ABSTRACT

Present research work was conducted to see the effect of “Hole in the Wall” experiment of computer literacy on attitude of village students towards using cyber resources, level of consciousness and social awareness. The sample size of this study is 100 village students (50 boys and 50 girls) age group of 10-13 years of Tundla tehsil of district Firozabad. Purposive sampling method was employed for the collection of sample units and schools and Experimental method was used for conducting the experiment. Three self-made scales were employed to collect the data which was collected at pre stage than experiment was conducted for 30 days. To know the effectiveness of experiment data was collected again at post stage. After collection of data at both pre and post stages It was analyzed using descriptive statistical techniques. Critical ratio was used to see the difference between pre and post experiment stages. On the basis of difference hypothesis were tested. As the result the researcher wants to say that “Hole in the Wall” experiment made significantly effect on the attitude towards using cyber resources, level of consciousness and social awareness. When he talks about the gender difference, no significant effect was seen so it can be said that both male and female village students were effected equally. In other words it can be said that both male and female village students have equal attitude to words using cyber resources consciousness and social awareness and many more results were discussed.
