ACKNOWLEDGEMENTS

The field work presented in this thesis was carried out under the supervision of Dr. M.K. Roy Chowdhury, the then Deputy Director General, Northern Region, Geological Survey of India. Dr. Roy Chowdhury, despite his extremely busy schedule, could always find time to look into the progress of this work and offer a word of cheer.

Laboratory work was planned and executed under the guidance of Professor I.C. Pande, Head of the Geology Department, Panjab University, Chandigarh. Several difficulties, which looked insurmountable, cropped up during the course of this work. These were solved to my benefit by Professor Pande, but for his help this work would have never taken the thesis form.

It was Shri Kedar Narain, Director, Punjab, Haryana and Himachal Pradesh Circle, who in fact suggested that I may utilise the work pertaining to the Tal investigation for my doctoral thesis. Thanks are due to him for extending facilities in field related to this work.

Shri G.N. Dutt, who succeeded Shri Kedar Narain as Director of P.H. & H.P. Circle, generously provided facilities and proper atmosphere at Chandigarh for completion of this work.
The manuscript of this thesis is much improved due to suggestions offered by my colleague and friend Shri S.V. Srikantia. Srikantia was a constant source of inspiration, especially during the depressive phases of the investigation.

The field work was carried out during 1967 and 1968 as a regular item of the field season programme of the Geological Survey of India. Thanks are due to the Director General, Geological Survey of India, for permitting me to utilise the data of this investigation for doctoral thesis.
